Abstract of corresponding document: **DE4420775**

The clamp (6) is arranged so that it can be moved longitudinally. Following the termination of the rinsing and drying operations, a gap wide opening is allowed by a movement of the clamp (6). The clamp is connected with an electric motor (11) across a gearing (14), which effects the push movement of the clamp (6). The electric motor (11) is connected with a circuit system, which controls the motor (11), for movement of the clamp (6) at the correct time, following the ending of the rinsing and drying operation.
